THE CENSUS: A Census of the One Million, the Six Million, and the Ten Million.

The census is the most precise and comprehensive measure of a country's population, providing a snapshot of the demographic composition of the nation.

The Census Bureau conducts a census every 10 years, collecting data on every resident of the United States. The information gathered in a census is used for a variety of purposes, including the distribution of federal funds, the redistricting of congressional and legislative districts, and the planning of public services.

The data collected in a census is also used to track trends in population growth and decline, migration patterns, and the distribution of the population by age, race, and ethnicity. This information is crucial for identifying areas of need and ensuring that resources are allocated where they are most needed.

The Census Bureau has been conducting censuses since 1790, and each census has been instrumental in shaping the course of American history.

The most recent census was conducted in 2020, and the results are expected to be released in 2021. The census is an important tool for understanding the diversity and complexity of the American population, and for ensuring that all Americans are counted.
